SLIDE BINDING

A picture worth taking is worth preserving. No matter how carefully you store and handle your unmounted color transparencies, they will collect dust, finger marks and scratches. To keep them perfect, you should bind them between glass. Then they are safe and you can easily clean the glass cover without ever touching the transparency itself.

Furthermore, glass-binding is the only way to

keep slides absolutely flat in the focal plane of the projection lens. And the better the lens, the more important this becomes in preventing out-of-focus areas on the screen. For wide-screen projection, it is vital. For speed and convenience, either Perrot-Color or Per-O-Slide binders are recommended. To bind large quantities of slides at minimum expense, glass plates, binding tape and metal masks are available.

PERROT-COLOR AND PER-O-SLIDE BINDERS

The new Perrot-Color and Per-O-Slide mounts offer you the fastest method we know of to mount 35mm transparencies permanently between glass. There are also Perrot binders for the popular new No. 126-size transparencies as well as $2\frac{3}{4}" \times 2\frac{3}{4}"$ and $3\frac{1}{4}" \times 3\frac{1}{4}"$ material. With adapter masks, slides from No. 120-size film can be mounted in the $3\frac{1}{4}" \times 3\frac{1}{4}"$ binders. After you have sandwiched your transparency between the uniformly thin cover glasses, it is only a matter of seconds to seal it securely in the metal binder, using the special Proloc quick-fastener.

Perrot-Color binders are packed with one of two types of cover glass — conventional and treated. The latter is especially surfaced to prevent Newton's Rings which appear as colored rings on the projection screen, degrading the picture. Since, in most cases, only the glossy side of a transparency poses a Newton's Rings problem, only one treated glass is necessary per slide "sandwich". So, the most satisfactory and economical way to use Perrot-Color binders is to get one package each of both treated and untreated glass, using one sheet of each type to bind a single slide.

When only untreated glass is used, it is best to use accessory metal Anti-Newton's Rings masks between the glass and the glossy side of the transparency to prevent Newton Rings problems.

Users of Superslides can also enjoy the advantage of Perrot-Color binders, since they are available with masks for this format. Outer dimensions of the Superslide binders are the same as those for 35mm transparencies.

For automatic projectors employing metal frame holders in their magazines and which do not accept the usual glass-mounted slides there is available a special, ultra-thin version of the Perrot-Color mount. It is sealed in the same way as the regular Perrot-Color mount, but a special quick-fastener is required. The ultra-thin binders are available for 35mm slides only.

Still another type of mount available is the Per-O-Slide — the answer to the busy hobbyist's prayer. The Per-O-Slide mount accepts your transparency complete with cardboard mount as it comes back from processing yet the outside dimensions remain the same as those of the cardboard mount. The only preparation involved is the pre-trimming of the cardboard — a matter of seconds when using the special Procut trimmer.

Another useful accessory for slide binding is the Perocut Film Trimmer for 35mm film. You can use it for cutting apart negative strips for filing or for accurate trimming of individual 35mm negatives or transparencies of several formats prior to binding them in glass. And it is a virtual "must" for anyone who processes his own color film.
