

## UNIVERSAL REPRONAR Slide Duplicator

A versatile new slide duplicator joins Honeywell's highly-successful line of color transparency copying instruments for beginner, amateur, advanced amateur and professional use — the UNIVERSAL REPRONAR. It's specifically designed to accept most 35mm SLR cameras through a series of accessory "T" adapters. It uses Honeywell's versatile Pentax Auto Bellows which can be removed and used for various aspects of macro photography. The Bellows accepts both the 50mm and 100mm Macro Super-Multi-Coated Takumar lenses, as well as Leica-threaded enlarging lenses with Pentax's special Leica adapter.

The Universal Repronar features a removable camera support, permitting its base to be used on a copy stand with large format cameras. Push button controls on the front panel make ease of operation a key feature.

### TWO LIGHT SOURCES

An ELECTRONIC FLASH — color balanced to approximately noon daylight — is built into the base; its high and low output is controlled from the front panel. Also controlled from the front panel is an INCANDESCENT LIGHT SOURCE used for previewing and composing the image to be photographed.

### THROUGH-THE-LENS EXPOSURE CALCULATIONS

Exposures are calculated with the camera's through-the-lens light meter which compensates for exposure changes due to magnification and differing slide densities.

### EASEL

The "vibrationless" easel is an integral part of the Universal's base. It has a flush-mounted opal glass screen through which the light from the electronic flash passes, plus slide copying capabilities up to 6 x 7 transparencies. A built-in filter holder beneath the easel accommodates standard-size gelatin filters for color correction or special effect work. 2¼x2¼ and 2x2 slide holders are supplied.

- Open flash button
- Truc "ready" light
- Regulated power supply for consistent exposures
- Fast recycle time — 1 to 6 seconds
- Low current circuitry — saves shutter contacts
- Accepts most macro and enlarging lenses

## REPRONAR MODEL 805A

### Slide Duplicator and Accessories

The Repronar 805A consists of a special precision 35mm camera, an easel with slide and filter holders, an electronic flash source with high and low output control, an incandescent light source for viewing the transparency to be copied and an adjustable exposure calculator. It can achieve the same professional results as the most expensive enlarger, even for black and white work; its simple adjustments and controls make it easy for even the inexperienced operator to turn out remarkable results in a very short time.

#### THE CAMERA

The special 35mm slr camera features a high-quality preset f/4.0 lens, a rapid film advance lever and film rewind crank. A selector button on the film advance mechanism permits multiple exposures. The camera and lens carriages move smoothly on a helical rack to vary the magnification and to achieve sharp focusing. A ground glass screen lets the user see the image exactly as it will photograph. Critical focusing is aided by a magnifier which flips over the eyepiece.

#### THE EASEL

The easel is an integral part of the Repronar base and has a flush-mounted opal glass screen approximately 3 1/4" x 2 1/2", through which the light from the electronic flash passes. A built-in filter holder beneath the easel accommodates standard-size gelatin filters for color correction or special-effect work. 2 1/4x2 1/2 and 2x2 slide holders are supplied.

#### ADJUSTABLE EXPOSURE CALCULATOR

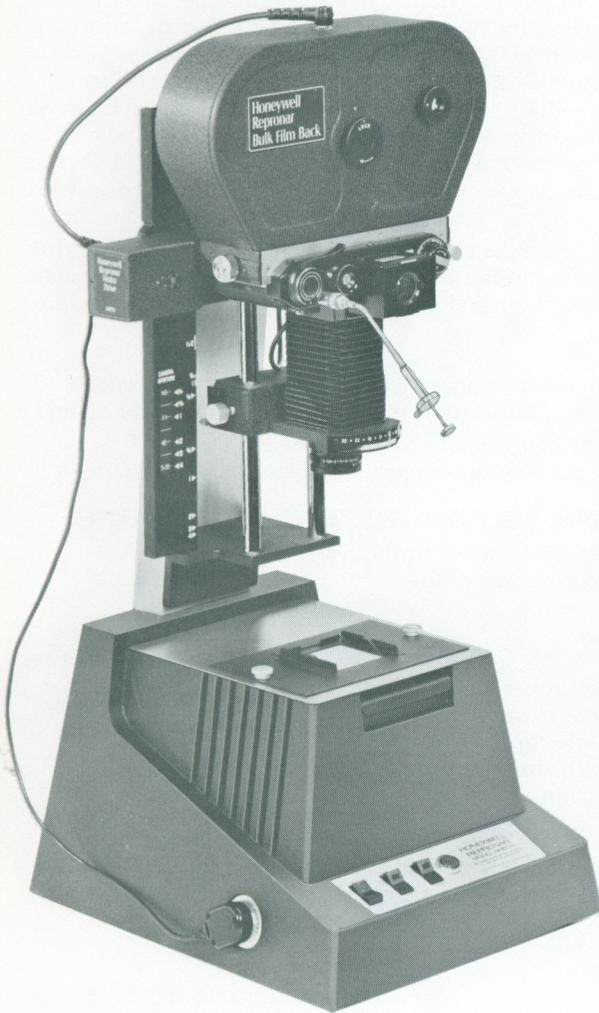

Indicates the proper exposure in f/stops for the magnification selected.

#### MOTOR DRIVE ACCESSORY

Attaches easily and securely to camera to cock shutter and advance film after each exposure — "automatically."

#### BULK FILM BACK

Holds 100 feet of film—excellent for those long jobs requiring more than 36 exposures! Must be used with the motor drive accessory. Solenoid-operated film pressure plate.

### Film Strip Kit II

Newly-designed, easy-to-operate kit machined of steel and aluminum for exceptional durability. Kit contains a film strip copier that transports and registers film strips to be copied and a slide holder to produce film strips from full frame (24 x 36) slides. Packaged with alignment reticle in a sturdy, dustproof case.
